1017. Clinical Significance of Eosinophilia in Children.
 (Клиническое значение эозинофилии у детей)
 L. L. GOLDBERG. Педиатрия [Pediatrics] No. 1, 13-17,
 Jan.-Feb., 1950.

Eosinophilia is quite common in children, but in spite of extensive studies of this subject its significance has not been clarified successfully yet. The belief that the appearance of an eosinophilia is a sign of recovery has not been confirmed; indeed, on the contrary, eosinophilia has been noted in chronic septic cases with a fatal outcome. Eosinophilia depends on the degree of formation of eosinophils during the height of a disease and also on the tonus of the sympathetic part of the vegetative nervous system during convalescence. As regards eosinophilia associated with intestinal parasites, the author examined 218 children with various parasites and found a definite eosinophilia in only 14.7%, while in 50% the eosinophilia was definitely absent. The author has also examined 55 children with various skin diseases and found that only in chronic eczema is definite eosinophilia regularly present.

met A pharmacological investigation of colthaycin. V. A. Shorin, L. B. Goldberg, and I. A. Kuznet. *Antibiotiki*, No. 5, 8-13 (1959). — J.L. of colthaycin (I) for white mice by intravenous injection was 33-40 mg./kg. and 200-250

3

mg./kg., subcutaneously. The picture of the general action of I on mice, guinea pigs, rabbits, and cats drew attention to its depressing effect on the central nervous system. I did not appear to have cumulative properties. Repeated subcutaneous injections of I did not exhibit any toxic effect on peripheral blood or on hemopoietic organs in guinea pigs. Pure preps. of I did not exhibit pyrogenic properties. I caused moderate hypotension, the intensity of which did not rise with increased dosage, but did increase slightly the continuation of hypotension. I showed little action on the dendritic nervous system. I decreased the pendular contractions of a section of rabbit intestine. A pure prepn. of I did not contain histamine. In large doses, I exhibited weak antihistaminic action. *Dionis M. Chace*

4920. A COMPARATIVE PHARMACOLOGICAL INVESTIGATION OF COLIMYCIN, MYCERIN AND NEOMYCIN (Russian text) - Goldberg L. YE. USSR Acad. of Med. Sciences, Moscow - 5.1 BIOLOGI 1958, 3, 3 (69-73) Tables 2. Colimycin was discovered in 1951 at the Institute of Antibiotic Research of the USSR, and mycerin in 1956, in the Institute for Epidemiology and Microbiology. Since both have chemical and chemotherapeutic properties similar to those of neomycin, a comparative study was undertaken. The maximal tolerated dose in the mouse is (i.c.) 176 mg./kg. for colimycin, 270.1 mg./kg. for mycerin, and 278 mg./kg. for neomycin. By i.v. administration the maximal tolerated dose is 0.2-0.4 mg. and the lethal dose 1.2-1.4 mg. per mouse for all 3 antibiotics. LD₅₀ for colimycin is 234.3 mg./kg. for colimycin, 270.1 mg./kg. for mycerin, and 278 mg./kg. for neomycin. By i.v. administration the maximal tolerated dose is 0.2-0.4 mg. and the lethal dose 1.2-1.4 mg. per mouse for all 3 antibiotics. LD₅₀ for colimycin is 45.0, for mycerin 55.3 and for neomycin 55.6 mg./kg. The effect on cats and guinea-pigs was also studied. In guinea-pigs, 200 mg./kg. daily causes deafness and toxic kidney damage in 3-4 weeks. Colimycin has a central hypotensive effect; there is no appreciable effect on the autonomic nervous system. Colimycin reduces the pendular movements of the isolated rabbit or guinea-pig intestine. With direct application of histamine, it was found that colimycin has a slight antihistaminic activity. The 3 antibiotics showed similar activities in all the experiments performed.

TITLE: The relationship of biological effect and chemical structure of water
soluble antibiotics derived from actinomycetes

SOURCE: Antibiotiki, v. 11, no. 9, 1966, 174-177

TOPIC TAGS: antibiotic, neomycin, monomycin, toxic effect, antibiotic effect, chemical
structure, *STREPTOMYCIN*

ABSTRACT: Streptomycin, neomycin, monomycin and kanamycin, water soluble
antibiotics derived from actinomycetes, have similar molecular
structures. They consist of aminocyclic residues and hydro-
carbons (aminosugars). Streptomycin contains N-methyl-D-glucos-
amine, L-streptose and streptidine. Neomycin, monomycin and
kanamycin contain 2-deoxystreptamine (1,3-diamino-4,5,6-trioxycy-
clohexane) which differs from streptidine in that it contains an
amino group in place of a guanidine and a hydrogen atom in
place of a hydroxyl group in the C₂ position. Neomycin is not
a homogeneous substance but contains neomycins A, B, and C

Card 1/5 . UDC: 615.779.931-011

ACC NR: AP6031633

Fig. 1.

(see Figs. 1, 2 and 3). The molecules of neomycin, monomycin and kanamycin contain respectively 6, 5 and 4 free amino groups and have similar physical and chemical properties. They are hydrophilic bases stable in neutral and alkaline water solution, and are effective against gram positive, gram negative and acid resistant organisms. Their toxicity is shown in Table 1; neomycin is the most toxic and kanamycin the least. Neomycin and

ACC NR:

Fig. 2.

FIG. 3.
monomycin degradation products are less toxic than their parent compounds. Neamine possesses marked bactericidal activity and 2-deoxystreptamine is the most toxic fragment. The order of toxicity of molecular fragments of neomycin is as follows: 2-deoxystreptamine>neamine>neobiosamine B>diaminohexose B>d-ribose. For monomycin products, toxicity decreases in the

following order: 2-deoxystreptamine-neobiosamine B (neomycin) diaminohexose B-4-glucosamine-d-ribose. Free amine groups play an important role in determining the biological activity of these antibiotics. Thus, Monomycin B which possesses 4 free amino groups instead of the 5 found in monomycin A is 35—50 times less effective as an antibiotic than monomycin A. Mono-, di-, and tri- substituted monomycin derivatives possess about the same antibacterial activity (from 35—50 times less than the unsubstituted compound), while pentasubstituted monomycin loses its antibacterial activity. Mono-N-acetyl derivatives of neomycin B and C are less active than monomycin B and C. Intense nephrotoxic effects are observed in mice after 45 mg/kg doses of neomycin, 150 mg/kg of monomycin and 300 mg/kg of kanamycin.

TITLE: Image blurring during observation of remote surface features

SOURCE: Mezhvedomstvennoye soveshchaniye po aktinometrii i optike atmosfery.
5th, Moscow, 1963. Aktinometriya i optika atmosfery (Actinometry and atmospheric optics); trudy soveshchaniya. Moscow, Izd-vo Nauka, 1964, 209-211

TOPIC TAGS: atmospheric visibility, atmospheric optics, image blurring, telescope observation, ground temperature

ABSTRACT: Over a period of several years, specialists at the Karadagskaya aktinometricheskaya observatoriya (Karadag Actinometric Observatory) and the Minskaya gidrometeorologicheskaya observatoriya (Minsk Hydrometeorological Observatory) have attempted to clarify the dependence between observation conditions and meteorological factors, terrain features, height of the line of sight, distance, and diameter of the telescope objective. The observations were made using special tables set up at distances of 400, 800 and 1600 m (in a plains area), 650 and 1200 m (in dissected terrain) and 1900 and 8000 m (when the line of sight was above the sea). These "tables" consisted of a system of black bands on a

Card 1/3

L 52761-65

ACCESSION NR: AT5011175

white background. Large, medium and small objectives were used. Optical observations were accompanied by measurements of soil surface temperature, temperature and humidity at heights of 0.5 and 2 m, and wind velocity and direction at 1 m. Observation conditions were evaluated from the angle of blurring $\Delta\beta$, equal to the difference between the angular dimensions of the narrowest bands distinguishable when there was blurring and when there was no blurring. It was found that in plains areas and in dissected terrain the surface temperature gradient exerts the greatest influence on the angle of blurring. There was found to be no relationship between the angle of blurring and wind velocity, absolute humidity or the absolute humidity gradient. This can probably be attributed to the fact that the method used was insufficiently precise for detecting such a relationship and if such a relationship exists it was masked by stronger effects. It was also possible to determine the dependence of the mean angle of blurring for telescopes of large, medium and small magnification on the temperature difference for distances of 400 and 800 m and observation heights of 0.5 and 1.5 m. In observations in dissected terrain, it was found that if there is a factor of high turbulence along the line of sight its influence on clear visibility is the greater the closer it is to the observer. TITLE: Influence of Ionizing Radiation Upon the Higher Developed Parts of the Central Nerve System (Vliyaniye ioniziruyushchego izlucheniya na vysshie chasti tsentral'noy nervnoy sistemy); Transactions of the Conference in the Institute of the Activity of Higher Nerves (Konferentsiya v Institute vysshey nervnoy deyatel'nosti)

PERIODICAL: Vestnik Akademii nauk SSSR, 1956, Nr 8, pp. 125 - 126 (USSR)

ABSTRACT: This conference was held from May, 6 - 10. It was attended by representatives of 31 scientific research institutes from Moscow, Leningrad, Kiyev, Khar'kov, and Gor'kiy. 26 reports were heard, which mainly dealt with the two following problems: The reaction of the activity of higher nerves of grown-up animals to an irradiation during their embryonal development, and the influence of small doses of ionizing radiation upon the activity of higher nerves of animals. The following lectures were held: V. Ye. Miklashevskiy and M. B. Golderg on the influence on rats of irradiation during their embryonal development.

Influence of Ionizing Radiation Upon the Higher Developed Parts of the Central Nerve System. Transactions of the Conference in the Institute of the Activity of Higher Nerves

SCV/56-58-2-3c/43

O.L.Nemtsova and Ye.I.Andreyeva, A.B.Yeliseyeva on the effects of irradiation on the 9th day of embryonal development.

N.A.Artyukhina on phenomena occurring after birth in animals irradiated before birth.

N.G.Mikhaylova on a considerable reduction of basic nerve processes.

I.A.Volodina on considerable disturbances of nerve activity.

I.A.Piontkovskiy on strong disturbances of the activity of higher nerves by gamma radiation.

V.I.Semagin on the application of small doses of radiation in the course of the entire embryonal development.

A.P.Chesnokova on the aftereffects of a single irradiation immediately after birth.

A.M.Ivanitskiy on the investigation of the bioelectrical activity of animal brains.

N.A.Rokotova and I.M.Torbanova on the influence of small doses of ionizing radiation on the state of biological objects.

L.Ye.Khouak showed that even small doses of irradiation cause functional modifications in the central nerve system.

Card 2/3

Influence of Ionizing Radiation Upon the Higher Developed Parts of the Central Nerve System. Transactions of the Conference in the Institute of the Activity of Higher Nerves

M.I. Agropolt'yants showed that the greatest modification of the activity of the higher nerves can be found three days after irradiation.

Ye.S. Meyserov, Kh.Kh. Yaruslin and A.I. Kharin on experiments with dogs.

AUTHORS: Miklashevskiy, V.Ye., and Gol'dberg, M.B.
TITLE: Conditional reflex activity of white rats subjected
to X-rays at the preimplantation stage of embryonic
development
SOURCE: Piontkovskiy, I.A. Vliyaniye ioniziruyushchego iz-
lucheniya na funktsiyu vysshikh otdelov tsentral'noy
nervnoy sistemy potomstva. Moscow, Neigra, 1961. 16-17. ✓

TEXT: Certain biological features and the conditional reflex activ-
ity of white rats, subjected to radiation at early stages of em-
bryonic development, were studied. 155 three-to-four-month-old white
female rats were used in experiments, resulting in 456 offspring
of both sexes. The following was recorded: a) duration of pregnancy
and birth, b) number and survival of offspring in control and ex-
perimental rats, c) somatic and hematology features of offspring.
A PYM-8 (RUM-8) X-ray tube was used (120 kV, 15 mA, AL-1.5 mm
and 0.5 mm Cu-filter, 20 cm focal distance, 20 kV and 150 mA).
The pregnant rat received a 200 r dose. (In L.I. Khodarenko, A.V.
Card 1-5)

Sydney, Australia
D-98 D987

Conditional reflex activity of . . .

shamir perforation method was used. Two series of experiments were conducted. Irradiation of the pregnant rat was noted to result in a delay in the term of birth, a drop in the number of offspring born. No deformities occurred in survived offspring born to rats irradiated on the 6th day of pregnancy. Their weight indicated that of the normals. Obtained data on conditional reflex activity indicated that the experimental animals fell behind the normals in the absolute number of combinations needed to strengthen the reactions to presented sonar signal stimulants. A statistical analysis showed, however, that the differences are not significant and that the former can take priority over the normals in the absolute value of the reflex magnitude to a positive tone. The normals take precedence in certain absolute indices, such as the rate of reflex strengthening to positive and negative tones. The rates of the conditional reactions to a strong and weak positive stimulant were found to be equal in both groups. The differential index is lower in irradiated animals. Functional testing revealed that the difference between the normals and experimental groups lay in absolute values of various indices. Evaluation of the data was carried out

[illegible]

Conditional reflex activity :

S/546/61/000/000/002/001
2298 D/17

in the antenatal irradiated group revealed a lengthening of the latent period and a drop in the value of the postdifferential response reaction to a positive signal. A statistical treatment of the obtained material showed that the observed difference in the group indices of the antenatal irradiated and non-irradiated specimens falls within the limits of incidental fluctuations. The second series of experiments was conducted to determine the effect of radiation in later stages of life on the antenatal-irradiated rats, starting at the 45th day of life: No significant difference was noted between irradiated and non-irradiated rats, in the number of combinations needed to strengthen the reaction to a presented positive sonar stimulant. An analysis of the magnitude of the conditional reaction to a positive sonar stimulant showed it to be less in irradiated animals. Strengthening of the differentiation is more easily accomplished in the experimental group. Data of the second experimental series on strengthening, latent period, and percentage of conditional reactions present, pointed to the fact that the irradiated animals differed very slightly from the normals, having only a lower reflex value to a positive sonar stimulant. The post

Conditional reflex activity of ...

tive index, i.e., the ratio of the conditional reaction values to the strong and weak positive stimulants, is greater than one in both groups of rats, indicating the presence of normal form interactions in the experimental animals. The following conclusions were made: Material of the first series of experiments indicated that the animals irradiated at an early stage of the antenatal period are surpassed by the normals in certain characteristics of the stimulant and active inhibiting process. The difference is slight. Analysis of the second series confirms the results of the first, namely, that ionizing radiation has no noticeable or obviously detrimental effect on the functions of the higher organs of the central nervous system in rats, irradiated on the 6th day of embryo genesis. The absence of organic and system differentiation during the moment of radiation effect rejects the possibility of a direct mechanism of possible disturbances of the higher nervous activity as a result of irradiation in the preimplantation period. The slight destructions are explained by the presence of the pathological effect from the impaired body of the mother, through radiation sickness which, in turn, lowers the functional potential of

AUTHOR: Goldberg, M.B.

TITLE: Changes in the peripheral blood of rats subjected to the effects of ionizing radiation in the antenatal period of development

SOURCE: Piontkovskiy, I.A. Vliyaniye ioniziruyushchego izlucheniya na funktsiyu vysshikh otdelov tsentral'noy nervnoy sistemy potomstva. Moscow, Medgiz, 1961, 192-201

TEXT: The author investigated the delayed after-effects of the harmful action of radiant energy in the blood-forming system of irradiated offspring. Three groups of female rats were irradiated, on the 5th, 12th and 18th day of pregnancy, respectively. A 200 r X-ray dose was administered with the PVM-2 (RUM-3) unit. Irradiation of the embryos on the 5th day of antenatal development - at the end of the pre-implantation period, caused wide-spread death of the animals, but the embryos which survived showed no somatic malformations. The healthy condition of the organs and systems of

Card 1/3

Changes in the peripheral blood ...

the survived offspring, however, was open to doubt. An assumption is made of a lag existing in the transfer from embryonic blood-formation to a normoblastic one, in rats irradiated on the 18th day of antenatal development. The irradiation on the 18th day of pregnancy definitely shows a remote effect on the blood-forming organs of the embryos. The higher counts of the erythrocytes, leucocytes, and hemoglobin are explained by occurring hyperregeneration, i.e., an increased activity of the blood-forming organs. The rats irradiated on the 18th day of pregnancy showed more noticeable deviations in the composition of the peripheral blood. The baby rats were born with signs of radiation sickness which last for a certain period of time. The experimental animals of all 7 irradiation periods showed a high variability in leucocyte content, indicating a high instability of the leucopoietic system in the irradiated animals. The following general conclusions could be made: 1) Rats irradiated on the 5th day of embryogenesis showed a higher hemoglobin count at birth than the normals. Blood smears of the experimental animals revealed normochromic macrocytosis, absence of anisocytosis, single polychromatophylls. 2) The action of X-rays on the 18th day of embryogene-

Card 2/3

S/636/61/000/000/013/013
D008/D008

Changes in the peripheral blood

sis resulted in higher hemoglobin, erythrocyte counts at birth than in normals. The latter is explained by a possible hyperregeneration of the blood-forming elements, occurring 1-15 days after the radiation. In the following days of the experiment - up till the 150th day - no differences in the hemoglobin and erythrocyte counts between the experimental and control animals were detected. 3) When irradiating rats on the 18th day of embryogenesis, signs of radiation sickness occur at birth: anemia and leucopenia were most apparent on the 7th day after birth. Up till the 150th day of the experiment, the hemoglobin and erythrocyte count increases, but does not reach figures which are characteristic of the hemoglobin and erythrocyte quantities in the control animals. 4) In all variations of the experiment, frequent fluctuations of the leucocyte count are noted, indicating an increased reactivity and lability of the neutrophil system of the irradiated animals. There are no figures.

Title : Stability of carotene in oily solutions

Periodical : Ukr. khim. zhur. 20, 408 - 410, 1954

Abstract : Various types of vegetable oils (refined sunflower oil, apricot oil, olive oil, and cottonseed oil) were investigated to determine their suitability as solvents during the synthesis of carotene compounds. The absolute losses of the carotene, dissolved in vegetable oils and the stability of this vitamin, were established. Three references: 1-USSR; 1-Ukrainian and 1-USA (1933-1948). Table; graphs.

Kazanskiy; of the eighth chapter, I.Yu. Sheydeman; of the ninth chapter, Ye. B. Trostyanskaya, and those of the tenth chapter, M.M. Gol'dberg and V.V. Chebotarevskiy. The section of the seventh chapter "Mechanizing production methods used in molding objects from plastics" was written by G.I. Shapiro, and the section of the ninth chapter "Mechanical reinforcement of articles made of nonmetallic materials" by V.P. Leont'yeva; the author of paragraph 5 in that section was I.Yu. Sheydeman. The authors thank Ya. D. Avrasin, V.S. Bondarev, and M. Ya. Sharov for valuable advice and B.I. Panshin, Candidate of Technical Sciences, for his assistance in readying the manuscript for publication. The book contains 180 figures and 30 tables. There are 50 references, of which 48 are Soviet and 2 English.

Card 3/23

Crystallization of the acidified mother liquor of the second (sugar) product. B. E. Kozul'shchikov, M. M. Goldberg and M. I. Shokhet. *Chem. Abstr.* 1939, No. 5, 12988 (1939). *Khim. Neft. Ind.* 1939, No. 9, 118. Coagulation of the colloids of sugar products by acids improves their cryst. properties. By the action of H_2SO_4 on the second molasses the colloids are coagulated and the salts of org. acids are decompd. The H_2SO_4 treatment must be carried out at a temp. of 50-60°, which is gradually lowered. The time of cryst. is 8 hrs. Optimum results were obtained by addn. of 2% H_2SO_4 on the wt. of molasses. Under these conditions there is little possibility of inversion of sugar. This treatment also decreases the losses of sugar by 0.18% of the wt. of the beets.

AUTHOR: Gol'dberg, M. M.

TITLE: Anti-corrosion primers and their application

PERIODICAL: Referativnyy zhurnal, Mashin. stroeniye, no. 1, 1962, 46, abstract
7B254 ("Lakokrasheniye materialy i ikh primeneniye", 1961, no. 6,
45-49)

TEXT: The author presents a survey on anti-corrosion primers used for the protection of various equipment in the USSR and abroad. He mentions the MS-105 (MS-105) alkyd-styrene primer, produced on the base of alkyd-styrene resin and intended for the protection of machine tool equipment and ferrous sheet metal instead of the no. 138 primer. Its pigment composition consists of red ochre and zinc yellow. The primer is applied by spraying. One of its important advantages is its quick drying in air, as a result of which it is possible already after one hour to apply the ASH-30 (ASH-30) nitro first coat and after 6 hours the ПХВШ-25 (ПХВШ-25) perchlorovinyl ground coating. Of the new primers the author mentions the АС-025 (АС-025) primer on the base of the Л-15 (L-15) resin (copolymer of vinyl chloride and vinyl acetate) and acrylated

Card 1/4

8/12/62/000/007/012/016
R004/A101

Anti-corrosion primers and their application

alkyd resin. The primer dries within one hour at normal temperatures, possesses a good adhesion and waterproofness and can be used in combination with perchloro-vinyl enamels and enamels on the base of vinyl chloride copolymers instead of alkyd hot-drying primers in agricultural machine building. The UR-012A (UR-012K) red primer and UR-012B (UR-142H) yellow primer on the base of the E-30 (E-30) epoxide-alkyd resin with additions of EPU (EPU) urethane as hardener are intended for use in tropical climate. Apart from their good corrosion resistance they dry within 4 hours at room temperature. The author analyzes a primer on the base of cyclic cacutcheuc, produced by catalytic isomerization (as a result of which a system of condensed hydroaromatic rings is formed). Owing to its low molecular weight, in comparison with cacutcheuc, cyclic cacutcheuc is able to form a solution of low viscosity with a high dry residue (approximately 50%) content. Cyclic cacutcheuc is soluble in white spirit. The advantage of coatings based on cyclic cacutcheuc is their good resistance to the effect of chemical reagents and to yellowing when heated up to 150°C. Abroad, chlorinated rubber (for chemically resistant coatings), oxidized rubber (for coatings of high heat resistance) and also hypalon ("khaypalon") became of great importance as film-forming substances for primers. The latter possesses a high resistance to the action of ozone and other oxidizing agents, resistance to abrasion, and

Card 2/4

Anti-corrosion primers and their application

5/122/52/000/001/012/016
A004/A101

elasticity. For producing coatings on the base of hypalon, it is necessary to preliminarily add a hardener. Generally, hypalon is mixed with other resins to increase its adhesion to metal. Great prospects offers the work carried out to find primers diluted with water for metal protection. Such primers can be produced on the base of phenolic resins in combination with alkyds of epoxy resins soluble in water and also polyvinyl acetate and polyacrylic resins. The use of primers diluted with water makes it possible to eliminate the inflammability and toxicity connected with the use of solvents. It is possible to add the primers diluted with water inhibitors of metal corrosion. It is stated that, apart from film-forming substances pigmented with red ochre or zinc yellow, it is possible to use some pigments for primer production: zinc cyanamide and tetra-oxochromate, lead cyanamide, calcium plumbate, potassium-barium chromate, lead subsilicchromate, chromium phosphate, zinc and calcium molybdates. The author presents a brief characteristic of each pigment. From the number of protective coatings used abroad, the author mentions coatings containing powdery lead. These coatings are mainly used for the painting of ships and chemical apparatus. The powder should be highly dispersed and contain no more than 1% impurities. To prevent oxidation, the powder is mixed with oil or plasticizers and is then added

Card 3/4

to the primer compound. Chlorinated rubber and epoxy resins, hardening in air,
are used as binders. There are 10 references.

PURPOSE AND COVERAGE: The book is a handbook which contains information on
lacquer and test of lacquers. It also describes the technical characteristics
and designs of plants engaging in basic lacquering and drying processes. The
book is designated for engineering and technical workers of lacquering shops
in machine building industry and for planning organizations.

Title : Eye trauma occuring in the streets in the
vicinity of power plants, heat and power
plants and boiler rooms
Periodical: Gig. i san., 1, 41, Ja 1955
Abstract : Discusses eye injuries caused by flying cinder
particles in the atmosphere of industrial
districts and on the basis of statistics
recommends instituting hygienic control against
air pollution by the Medical Service. 1 ref., 1949
Institution: Institute of General and Municipal Hygiene,
Academy of Medical Sciences, USSR
Submitted : Ap 15, 1954

Title : All-Union Conference on Problems of the Hygiene of
Atmospheric Air and Water, and Sanitation
Bacteriology

Periodical : Gig. i. san., 12, 45-47, D 1955

Abstract : Discusses briefly the reports on various problems
presented at the Conference in Moscow (May 16-20,
1955) organized by the Institute of General and
Municipal Hygiene, Acad. Med. Sci., USSR.
